

Week 1 Report

VM Setup, Static Website, and Git Workflow

Objective

Establish the foundational Virtual Machine and Git workflow used throughout this project.

What Was Done

- Set up a Virtual Machine using VMware Workstation Pro, running Ubuntu 26.04 LTS.
- Configured networking (NAT) and enabled SSH access, allowing the VM to be controlled from the host laptop's terminal.
- Created a simple static website and hosted it on the VM as a hands-on deployment exercise.
- Connected the hosted project to a GitHub repository (`hsk-2004/CodeQA-App`).
- Made modifications to the hosted site and practiced the complete Git workflow: `git add` → `git commit` → `git push`.

Key Learnings

VM fundamentals: allocating CPU/RAM/disk, installing an OS, and enabling remote access via SSH.

Git + GitHub workflow: initializing a repository, committing changes, connecting a remote, and authenticating pushes using a GitHub Personal Access Token (required since GitHub no longer accepts account passwords for Git operations).

Outcome

A working Ubuntu VM, reachable via SSH, with Git configured and a GitHub repository ready to receive all subsequent work (Weeks 2-4 all build on this same VM and repository).
